EXECUTIVE SUMMARY

Business overview

WAIH is a company specialized in the production of the smart mirror called MIA. It was founded with the goal of facilitating customers' life in the area of clothing by combining technology with fashion so as to create in this way a unique and personalized styling experience for our customers. By leveraging artificial intelligence, we want to provide an innovative solution to the huge problem of what to wear, giving a wide range of ways to combine clothes by swapping pieces in the tactile touchscreen.

Our team of engineers have been developing this software for months with the objective of revolutionizing the way individuals approach fashion and wardrobe management. We have been working with the top fashion school of Spain, Escuela Javier Barroeta, so as to develop this private and unique AI.

Our product

MIA (Mirror Intelligence Artificial) is our innovative product that emerges from the idea of having an entertaining way of dressing up, making this mirror special by its uncommon characteristics. We aim to help people to choose an outfit and get a better organization in their wardrobe.

MIA is an intelligent mirror equipped with a high-resolution touchscreen and a unique artificial intelligence software which people can interact with. This product allows the customer to choose between different options according to their current necessities.

The mirror has a camera installed that turns on every time the option "scan clothes" is chosen, so in this way the client can add new garments to their clothing inventory by simply scanning them. If this option is not selected, the camera is hidden inside the mirror and turned off, so as to guarantee customer's security and trust. This camera is also capable of scanning the user so as to

recommend the type of clothes that fits the client more according to its body shape, the skin tone, the preferred style and suggest places where the clothes can be bought.

MIA's implemented technology allows customers to create new outfits based on their clothing inventory or style preferences(sporty, casual, formal, etc.), depending on the option chosen, letting clients to swap the pieces they don't want to use and try with almost infinite variations. It also keeps the consumer up to the current trendy clothes and shows the weather conditions. It has installed led lights for a higher brightness and illumination and includes speakers where music can be played whenever the buyer wants.

This mirror is powered by a plug. It has a standard size of 60x140cm and a width of 3cm, with a weight of 15kg, allowing it to be carried easily and installed wherever the buyer wants. It is covered by a layer of anodized aluminum to protect the electrical components installed on the back of the mirror and in this way keep it in good condition.

COMPANY ENVIRONMENT

Competitive advantage (VRIO)

Valuable: MIA is really valuable offering for one part services common to other intelligent mirror such as date, weather, lightning or music streaming, to other unique features such as the processing and fitting of virtual outfits that adapt within the contour of your body, it also has an calendar that you can use day to day, introducing also the possibility of presenting other outfits based on temporary events such as nacional parties, or private meetings, overall MIA presents good value.

Rarity: Although intelligent mirrors are pretty known and multiple companies can produce them, what makes MIA rare is the private software/ia that runs the mirror, produced privately without any outside intervention or shadowing, the rarity increases since we are the first company that produces these types of mirror.

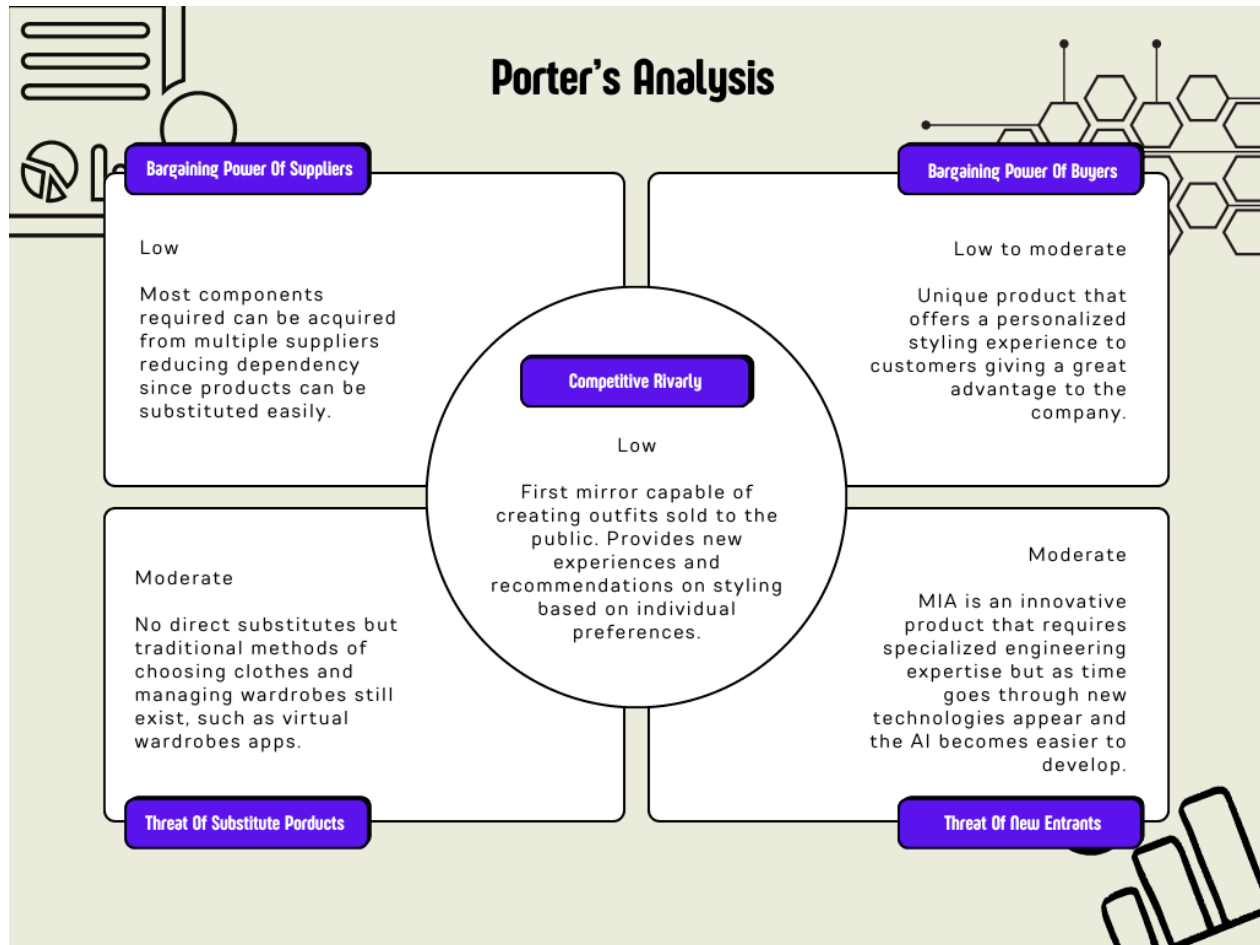

Imitability: Really hard, it is possible to imitate partially, but without our help, the development of another "MIA" would be really time consuming, economical and human resources.

Organization: There is a built infrastructure with production and assembling, and also has an office for all administrative actions, plus customer service and human resources.

The constant software improvements are organized within one small team of engineers that also take care of cybersecurity and the marketing and sales team is also in full functioning.

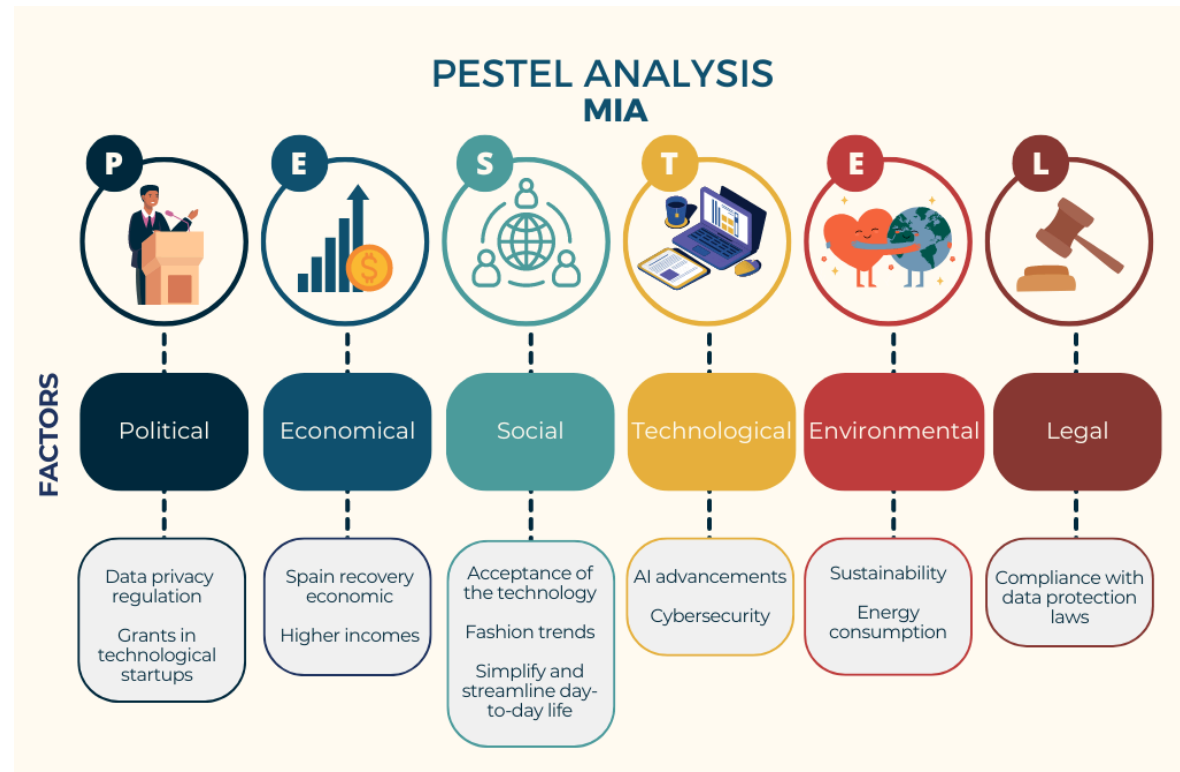

This VRIO analysis confirms that MIA has the competitive advantage to be successful in the market.

Porter's Analysis

PESTEL

PESTEL analysis is a management tool that helps identify and examine external factors that may influence the performance of our company.

Political: we ensure the protection of users' personal information due to the spanish data privacy regulations *RGP (Reglamento general de protección de datos)* . Additionally to this political factor, we have government support in the form of grants, which are given for innovation and growth in the AI and technology sectors.

Economic: due to Spain being in a stage of economical recovery, the expanding middle class is willing to enhance their lifestyle through technological sophisticated gadgets. Hence, positioning our AI mirror company, which offers affordable luxury, in a market where there appears to be significant interest in our offering, shows advantage.

Social: our market, which is focused on Spanish customers, not only shows a high acceptance of the technology in their daily lives but also demonstrates a well-established fashion culture. This is the reason why we have chosen to collaborate with a fashion school; it enhances the accuracy of our product and also strengthens our brand's credibility in the fashion industry. As we aim to simplify people's lives by providing a solution to the time-consuming task of creating new outfits daily, our AI mirrors offer personalized recommendations, creating a unique technological fashion experience.

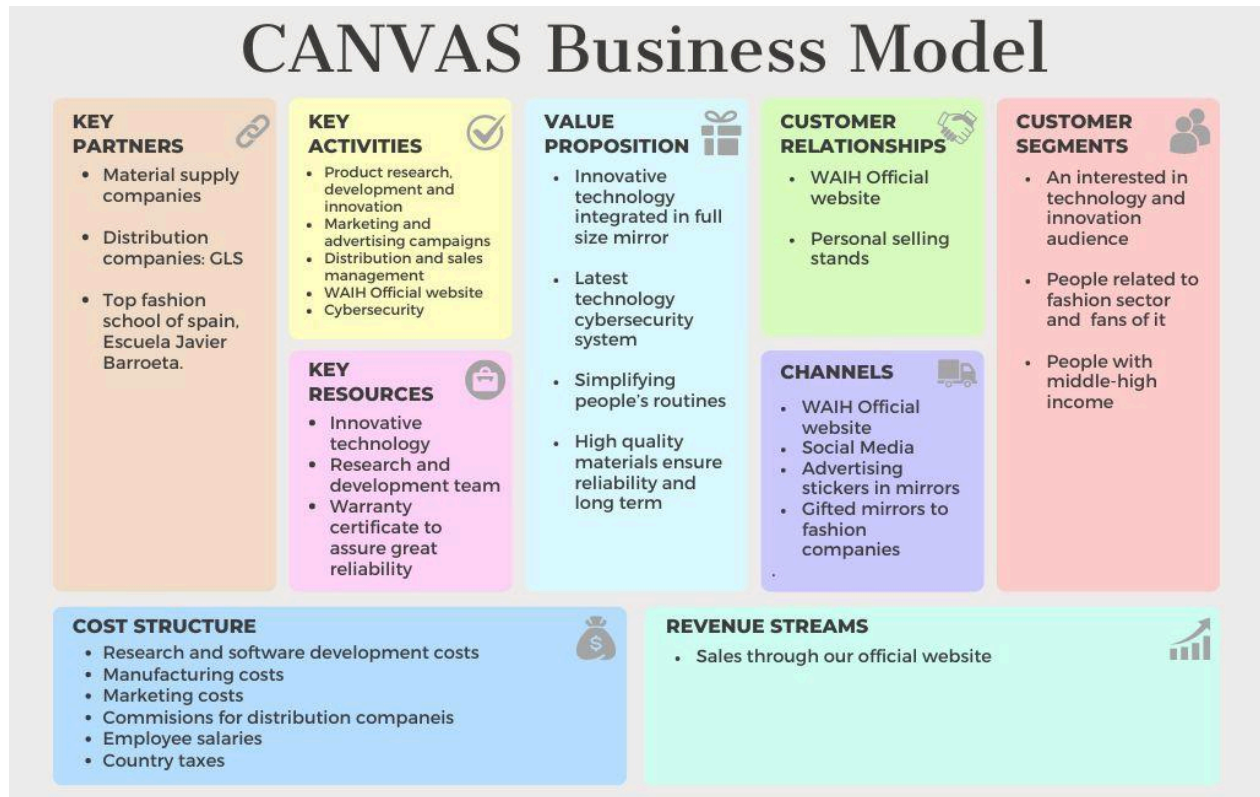

Technological: the collaboration with a fashion school has let us develop an innovative AI technology for personalized outfit recommendations, demonstrating our commitment to innovation. What is more, our team of cybersecurity experts ensures the security of our AI systems, creating trust with our users.

Environmental: one of the main values of our company is sustainability, this is so that it is reflected in our eco-friendly manufacturing processes. Minimizing our environmental footprint aligns with our commitment to reach a high-sustainable company and to our corporate social responsibility.

Legal: even though nowadays our company has opted not to patent our AI algorithm, (due to its elevated costs) we protect our information through other methods including copyright protection. Following the data protection laws, including *RGP (Reglamento general de protección de datos)* ensures the privacy and security of the data collected for our customers outfit 's recommendations.

CANVAS

Below we attach our business CANVAS Model, where we enumerate our principal resources, audience, and distinctions of our company, as well as the costs and incomes we have.

COMPANY DESCRIPTION

Legal form

WAIH is organized as a Limited Liability Company (LLC) registered in Madrid, Spain. We opted for an LLC structure due to its multiple advantages such as the simplicity in administration, the limited liability protection to its members, the flexibility it offers with respect to the management structure and its potential tax advantages. However, we are contemplating the idea of changing to a corporation in the future to facilitate external investment or public offering once we are established and earning better incomes.

Target

Our main target are people interested in adopting a new type of technology to improve their lifestyle and improve their way of dressing. We choose to focus on these types of public as they fulfill the characteristics of the customer that our product looks for. These types of customers value personal style, efficiency, and technology in their fashion choices, making them ideal customers for MIA. We are also focused on the middle-high income level people since the product requires a minimum salary income because it combines high quality materials and characteristics that can not make it affordable for every public.

Company's corporate and competitive strategy

Our company has developed a corporate and competitive strategy to ensure a strong market position and growth.

Our pricing strategy is based on ensuring profitability and offering our customers a fair value. To determine a price that allows us to maintain a minimum level of profitability while remaining competitive in the market we had to consider our costs (research, development, materials, manufacturing and operational expenses) .

Meanwhile, our differentiation strategy is based on our personalized AI technology and algorithms as well as the ongoing innovation with which we provide a unique fashion experience.

Moreover, we have both backward and forward integration in our vertical scope. By backward integration, we ensure quality in the supply chain, securing essential components for our AI mirror. Currently, we collaborate with Chinese companies to obtain the materials and components. On the other hand, forward integration allows us to enhance distribution channels, that is why we partner with GLS for efficient distribution services.

While our initial focus is the Spanish market, our expansion plans extend to an international level where we will be able to reach key cities where there is high demand for innovative fashion technology solutions.

With respect to the product scope, with Mia we converge fashion and technology and in this experience we include smart accessories and augmented virtual reality, which we plan to expand in the near future as we have a team of engineers that look forward to the innovations.

Furthermore, we plan to expand our market by introducing additional features to our product with the work and research done by our AI developers, so that we are up to the evolving consumer needs and expectations. What is more, we plan to have strategic partnerships with major retailers or even tech giants; this will solidify our position as leaders in fashion technology.

PRODUCTION SYSTEM

Production Cost

Designing and development of the interface and the IA were made during a period of 6 months, this resulted in a chip that can be installed in our mirrors, the total money invested in this process is 64k euros.

The sourcing of electrical components and materials to build our computers is managed by our production and distribution manager. I will provide a quick description of our providers and gather them in a table for better visualization.

The two way mirrors are sourced from Lumnis Films. the led displays from Direct Industry. the bulk of electronics from Win Source Electronics. The wifi modules are from Beijing Dwin, the mirror outside frame and protector are from Molduras y Cuadros Garcia. and the production of our chips from TSMC.

We receive these materials in our warehouses where they are sorted and organized for our workers. We impose a quality check on all materials and then we start the assembly process. We do not have assembly lanes as the price of the machinery is really high but we expect to be able to structure a product plant layout when we can capitalize enough on the machinery and our company growth.

Right now the assembly is by hand being the responsables our electronics department, it takes approximately 7 hours to assemble 1 mirror and do a quality check on the final product (hardware wise).

Once the physical body is correct, our chip, the core of MIA is installed and runned, a final quality check is done to ensure the correct functioning of both software and hardware.

Finally MIA is packaged with an EPS frame and prepared to be collected by the distributors, for distribution we choose to work with GLS, but we are studying the access to other networks such as Amazon, Seur..etc

PRODUCTION COST PER UNIT		
Component	Description	Approximate Price (euros).
Mirror	Two-way mirror with suitable dimensions	220
Display Panel	LCD or LED display panel	90
Microcontroller	Raspberry Pi or Arduino board	40
Sensors	Motion sensor(x3)	60
Camera	Webcam or camera module for gesture recognition	30
Speakers	Integrated speakers for audio output	15
Connectivity Modules	Wi-Fi module.	20
Frame/Enclosure	Frame or enclosure to hold components	50
Power Supply	Adapter for power	10
Miscellaneous Components	Wires, connectors, mounting hardware, etc.	60
Packaging	EPS Frame + cardboard.	8
Software Development	MIA chip.	200
TOTAL PRICE OF PRODUCTION (1 UNIT)		803

Price of production can rise to 830 accounting to inflation and whatnot, but we will use the value of 803 euros for calculations.

We are selling the product at 2100 euros, we will study the market and raise the selling price as we see accordingly since a normal smart mirror of this size (full body) can sell for up to 1200 euros and we believe once people recognize our brand we will be able to enlarge the margin.

The margin at 2100 selling price would be 1297 euros.

The total production in the period of 5 years [2024-2028), (for understanding the income statement and balance sheet) is shown in a table below.

Since our production is under demand, our units sold are equal to units produced.

Year	Units sold	Net-profit	Units needed for deficit	Qo = units sold + units deficit
2024	500	(540.160)	417	917
2025	800	-508670	393	1193
2026	1800	-254760	197	1997
2027	3100	116390	(exceeded Qo by 90)	3010
2028	4000	330730	(exceeded Qo by 255)	3745

MARKETING PLAN

Strategic marketing

Analysis of the Situation

-Market Analysis: consumers seek immediate personalized and convenient experiences; adopting digital solutions enhance their fashion experience. That is why the demand for AI-powered fashion solutions is increasing.

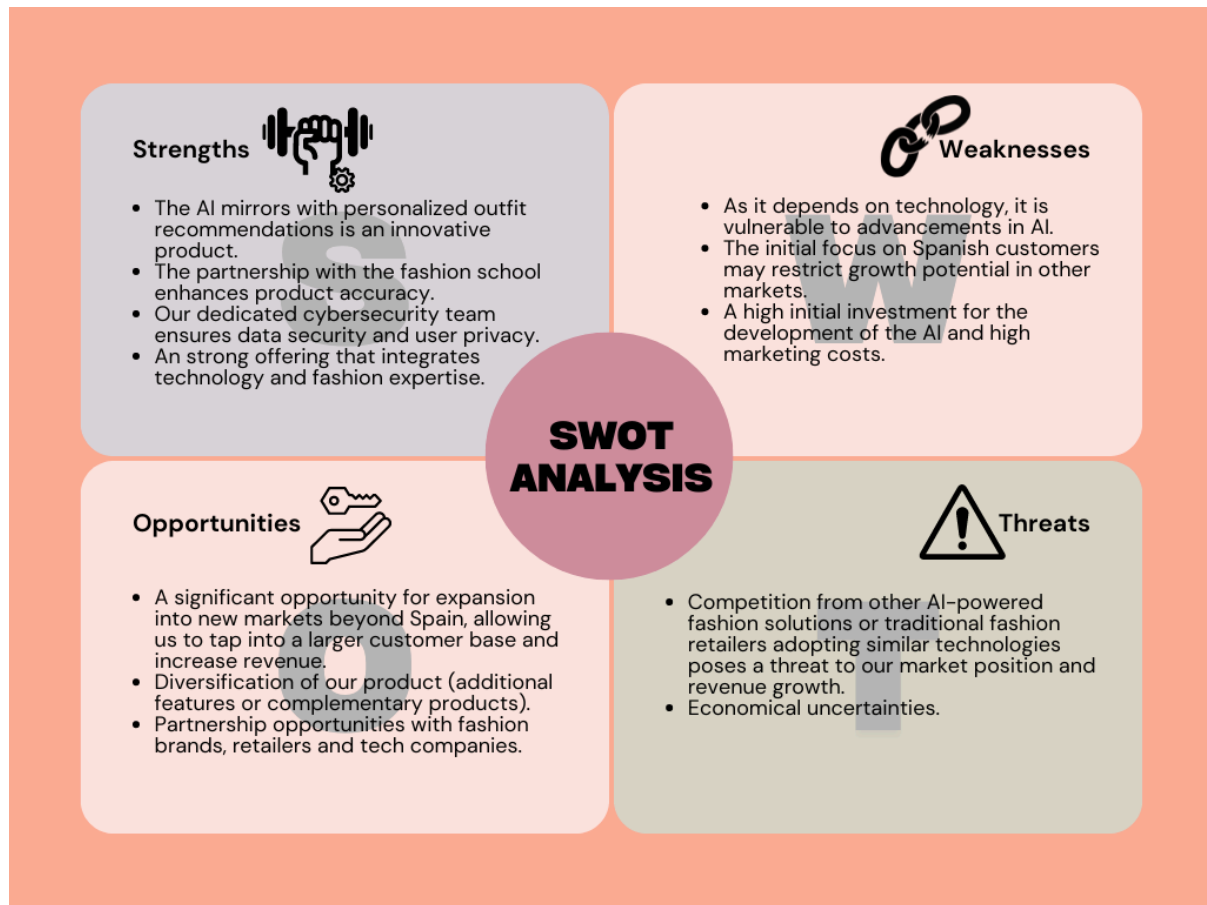

-Competitor Analysis: our main competitors could include established fashion brands starting to integrate AI technology into their offerings as well as tech startups specializing in fashion-related AI applications.

-Environment Analysis: our company operates within an environment influenced by technological advancements, changes in the consumer preferences, economic instability, and regulatory requirements.

-Internal Analysis: our company has a dedicated team of experts in AI technology and a great partnership with the fashion school *Escuela Javier Barroeta*, to enhance product accuracy.

Diagnosis of the situation (SWOT Analysis)

To implement our strategic marketing plan, it is essential to make a diagnosis by analyzing the company's internal strengths and weaknesses, as well as external opportunities and threats in the market. This analysis is known as a SWOT analysis; SWOT is a key tool to develop effective marketing strategies to optimize strengths, overcome weaknesses, leverage opportunities, and manage threats.

Definition of the company objectives

As our company is a startup our main objective is to establish MIA the AI mirror, as a leading solution in the fashion technology market, initially focusing on Spain.

Our goal is to increase market share and brand recognition in this market segment. Once we have achieved a strong position in the market, we aim to enhance MIA by adding new features and additional functionalities for entertainment purposes, such as watching TV or playing games. What is more, as we plan to expand our market into other countries, we will make use of machinery to benefit the manufacturing process.

Formulation of the strategies

-Segmentation: our strategy involves focusing on individuals who prioritize fashion and innovation but we also look for the people that do not usually have much time to plan outfits everyday that seek convenience and are willing to invest in products that enhance their lifestyle. We divide our market into groups based on age, gender, income, and lifestyle preferences. This enables us to customize our marketing strategies and product offerings to the preferences of each group.

-Positioning: our aim is to position MIA as an indispensable accessory for fashion enthusiasts by integrating personalized outfit recommendations and the concept of an innovative technology to elevate the overall fashion experience. To distinguish it from competitors, we seek convenience, accuracy and style that could be just obtained by our mirror that has an AI developed by our team and working hand to hand with the industry of fashion. We look for a connection with our target market, establishing MIA as an essential item in their daily routines.

Marketing mix

In order to stand out among other companies and consumers, as well as to be more popular in our society, we have established a powerful marketing mix that we modify depending on the number of sales we obtain each year.

Product

Our brand WAIH (When Artificial Intelligence Happens) is an innovative firm, created to ease our lives through the usage of one of the main revolutionary technologies we own nowadays, which is artificial intelligence. The importance we attribute to the adaptation of world innovations can be reflected in the firm's logo.

Our stamp has been designed intentionally in such a manner that when we leave it in hands of people's imagination each one can interpret a different conception of our business emblem. The principal aim of our company's logotype is to reflect, through simplicity, the idea of an open mind to the future. It means not to fear technological advances, since they are less complex than they seem. To reinforce this outlook of the future, our company is focused on improving people's routines to make their lives easier progressively, starting with the fashion sector.

The only item we currently offer is MIA (Mirror Intelligence Artificial), which is given that name, in reference to the three main features it possesses and discerns from the rest of conventional mirrors and AIs. MIA is a tangible product planned to be functional and aesthetical. Our powerful source is the technology it has integrated. It's a conventional full size mirror, with potentially innovative technology. One of the most notable qualities that MIA owns is that, since it is manufactured of especially fragile components, such as the tactile mirror screen, the retractable camera and other hardware components, we must be cautious with its displacement and distribution.

Consequently, we opted for a simple and straightforward packaging, with environmentally well disposed materials. Those are, fundamentally, big rectangular recycled cardboard boxes, with our company name written on them, and our stamp, as well as the energy efficiency label of MIA, and also, expanded polystyrene used to preserve the item.

Finally, in the interior of the package we situate MIA's user manual, to assist our consumers in their configuration process, and the warranty certificate to assure our buyers of the reliability of our product. This document is valid until two years after the acquisition of our exclusive mirror, thanks to the good quality materials we invested on it.

Price

MIA, as an innovative mirror, created by previous research and high grade components was launched in the market with an initial price of 2100 euros, which is a reasonable amount for us, since it is expected to cover the company's expenses in a couple years.

Taking into account that our price elasticity is over 1, which means that when we raise the price, the demand will decrease and vice versa, we have concluded that this price is the most stable one, in order to have a good number of buyers and a reasonable income. But we need to be aware of new competitors, so prices may change according to them, and to how well known we are in the market.

Placement

Our placement strategy is completely based on 1 type of distribution channel, which is the direct one. That is to say, that we are in charge of selling our own product to final consumers through our official web page, and then distributing them to final consumers through transportation companies like GLS, with an 8% commission. But we do not rule out, in the future, having agreements with merchandise agents, like Amazon, to reach more clients.

Promotion

Our way of gaining consumers' attention is mainly through advertisements. We have established several arrangements with big fashion firms and public places, in order to stick on their mirrors our advertising stickers. So, we are taking advantage of one of the principal features of our item to diffuse its functionalities and catch everyone's attention, as we all look in the mirror. An extra way to sponsor our product is through social networks, in order to reach more consumers from our targeted audience. Furthermore, we have gifted five MIAs to different fashion companies, in order to allow people to try our product.

Another promotion strategy we have applied is the personal selling as a closer method to buyers. We have settled a few stands in some shopping centers to get more people to know our product and our company in a more particular way, giving those who are more intrigued in our product, the opportunity to talk about our cybersecurity, how to use MIA, its principal benefits, etc.

Finally, the last method we have implemented recently is sales promotion, in which we decided to offer free distribution costs and free installation costs to the first 50 buyers, in our official web page, and we will be launching new promotions in future occasions, to keep the attention of new potential buyers.

FINANCING AND INVESTMENT

Sources of funding

Each one of the members (4 members), with 20.000 euros each, we gathered a fund of 80.000 euros which we decided to invest each year.

The Spanish Government accepted giving us a grant for 40.000 euros, for being a startup I+D of new creation.

We also asked for a loan from the bank, which granted us a 150.000 loan with 12% interest for 5 years.

In a close future we will present this product to solitaire investors to try to gain more funding and accelerate the growth process, right now the startup is private so once we start to gain more attention and we have enough resources, we will enter the stock market where we will work with new shareholders.

Investment plan

Since it's our first year the investment plan is non-existent due to the factor we need to make ends meet, but we will probably strategize a plan to invest moderately into other I+D companies, index funds or crowdfunding sites.

Right now all our efforts and economic strength is reinvested into the company.

Economic and financial profitability

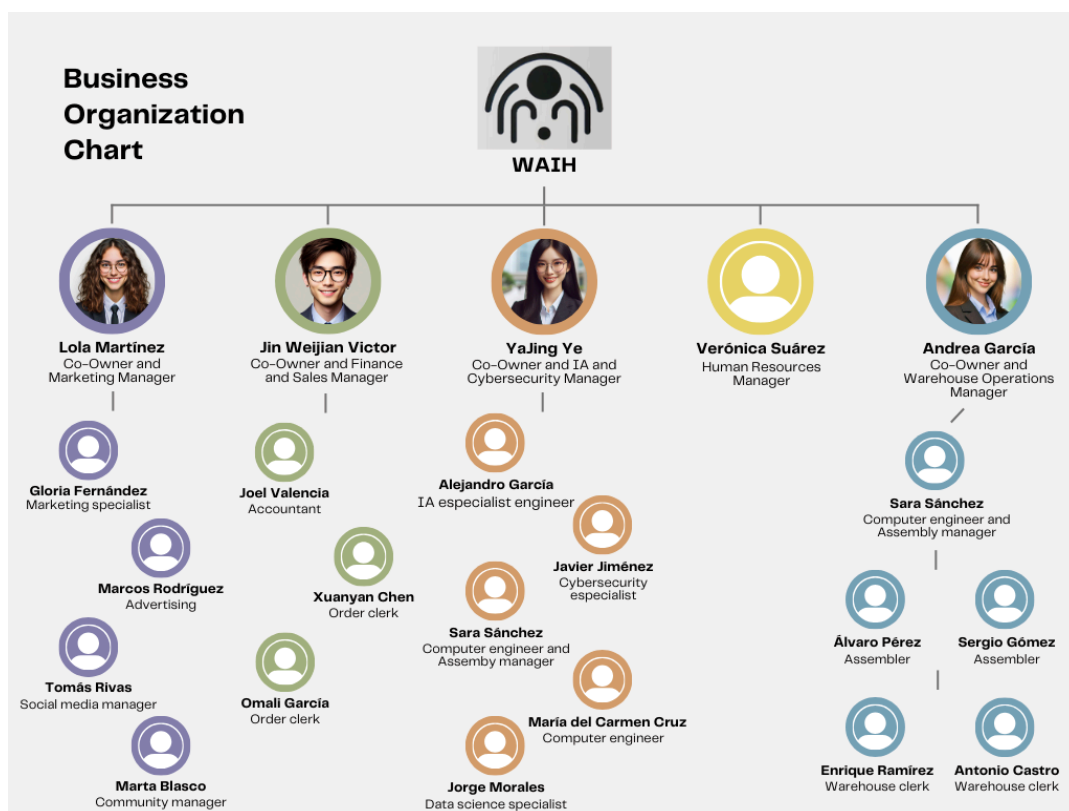

With respect to the ratios of our company, we can observe that in the first years, the economic profitability is negative which means that we have difficulties to generate profits, but according to expectations, we will be able to solve them in our fourth year.

Also, our financial profitability shows our benefits according to the inversions we receive, and as we don't have investors, our profitability is low.

RATIOS

ORGANIZATIONAL STRUCTURE

Our company is committed to the business objectives we have, which are to grow as a collective to reach a global level. To get to that goal, we have settled an organization based on directors, department managers, and the rest of employees, in which each power level has different goals. The directors are especially focused on the company achieving global recognition and progressive financial evolution, as well as providing the best qualities to both employees and consumers. The tactical goals of the directors department's are to carry out the section's tasks organization, to improve our product with updates and greater cybersecurity, as well as achieve a larger audience. Finally, the objectives of the rest of the employees are day-to-day tasks, such as ensuring that everything works correctly, that they have a clean and orderly workplace, and that they respect the rest of their workmates and materials. Below we attach an organizational chart of our company:

As a startup company, we cannot dispose of a large staff of workers, that is why we have chosen to hire the best individuals with limited experience, and then in the positions with a greater responsibility, more experienced people.

A quality to highlight about the organization of our company is that we are very committed to respect among others, to generate a comfortable work environment and that's thanks to the team building activities we carry out and to the work of the human resources department. This section was crucial in the creation process, because it assisted us to establish bases for workers and salaries in accordance with the jobs required, which are the following:

- Co-owners and department managers: 3800€ per month, based on a 40-hours work week.
- IA and cybersecurity department employee and assembly manager: 3200€ per month, based on a 40-hours work week.
- IA and Cybersecurity department employees: 2800€ per month, based on a 40-hours work week.
- Marketing employees: 700€ per month, based on a 20-hours work week.
- Accountants: 1400€ per month, based on a 40-hours work week.
- Order assistants: 1200€ per month, based on a 40-hours work week.
- Human resources department manager: 800€ per month, based on a 20-hours work week.
- Assemblers: 1400€ per month, based on a 40-hours work week.
- Warehouse clerks: 1200€ per month, based on a 40-hours work week.

Anyways, we expect that in the future, as we grow as a company, we can increase the workforce and raise salaries proportionally, and also study the possibility of a 7 hour working day!
